### 3.11 Larynx

Table 3.1ו1
Overview of key epidemiological parameters for Germany, ICD-10 C32

| Incidence | Women | $2017$ <br> Men | Women 2018 |  | Prediction for 2022 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | Women | Men |
| Incident cases | 570 | 2,820 | 540 | 2,770 | 640 | 2,600 |
| Crude incidence rate ${ }^{1}$ | 1.4 | 6.9 | 1.3 | 6.8 | 1.5 , | 6.4 |
| Age-standardised incidence rate ${ }^{1,2}$ | 0.9 , | 4.7 | 0.8 , | 4.6 | 1.0 | 4.1 |
| Median age at diagnosis | 65 | 67 | 66 | 67 |  |  |
| Mortality |  | 2017 |  | 2018 |  | 2019 |
|  | Women | Men | Women | Men | Women , | Men |
| Deaths | 201 | 1,182 | 203 | 1,201 | 213 , | 1,217 |
| Crude mortality rate ${ }^{1}$ | 0.5 , | 2.9 | 0.5 , | 2.9 | 0.5 , | 3.0 |
| Age-standardised mortality rate ${ }^{1,2}$ | 0.3 | 1.9 | 0.3 | 1.8 | 0.3 | 1.8 |
| Median age at death | 71 | 70 | 72 | 72 | 73 | 70 |
| Prevalence and survival rates |  | 5 years |  | 10 years |  | 5 years |
|  | Women | Men | Women | Men | Women | Men |
| Prevalence | 2,000 | 10,400 | 3,300 | 17,700 | 5,400 | 30,000 |
| Absolute survival rate (2017-2018) ${ }^{3}$ |  | 56 (48-62) |  | $37(30-41)$ | 1 |  |
| Relative survival rate (2017-2018) ${ }^{3}$ | 63 , | 64 (54-72) | 52 | 51 (41-56) | 1 |  |

${ }^{1}$ per 100,000 persons ${ }^{2}$ age-standardised (old European Standard) ${ }^{3}$ in percent (lowest and highest value of the included German federal states)

## Epidemiology

The larynx is almost only ever affected by squamous cell carcinomas. Men develop this cancer considerably more often than women: There were approximately 3,310 new cases in 2018, but only about one in five affected a woman. In the course of a lifetime, one in 200 men, but only one in 1,100 women in Germany will develop laryngeal cancer. The median age at diagnosis in 2018 was 66 for women and 67 for men, which is earlier than for cancer overall. The age-specific incidence rates show an age peak between 60 and 75 years for women, and between 65 and 75 years for men.

The incidence and mortality rates for men have decreased since the end of the 1990s. The rates for women, on the other hand, have remained almost constant.

The relative 5 -year survival rates for women ( $63 \%$ ) and men ( $64 \%$ ) do not differ significantly. A higher proportion of early tumour stages (stages I/II) are diagnosed in men ( $52 \%$ ) than in women ( $46 \%$ ) (according to the $7^{\text {th }}$ TNM edition).

## Risk factors

Regular cigarette consumption and excessive consumption of alcohol are main risk factors for the development of laryngeal cancer. The combination of both factors is particularly harmful. It is also known that these tumours are associated with (occupational) exposure to asbestos, ionising radiation such as from uranium, aerosols containing sulphuric acid, polycyclic aromatic hydrocarbons and coal and tar products. Cement and wood dust appear to be less important.

Infections with human papillomaviruses (HPV), especially HPV 16 , are responsible for the development of a small proportion of laryngeal carcinomas.

The influence of lifestyle and diet has not yet been clearly clarified, as tobacco and alcohol consumption override the influence of other factors in the majority of those affected. However, there are indications that an unbalanced, vitamin-poor diet with excessive consumption of meat and fried food can increase the risk.

A genetic predisposition is also assumed, as an increased incidence of laryngeal carcinoma has sometimes been observed within a family.

Figure 3.11.1a
Age-standardised incidence and mortality rates by sex, ICD-10 C32, Germany 1999-2018/2019, projection (incidence) through 2022 per 100,000 (old European Standard)

Incidence rate: — Women - Men

Mortality rate:
.-- Women -.- Men
